Skid-steer loaders, also known as wheeled loaders, are widely utilized in a variety of industries and are used for a variety of purposes. Skid-steer loaders are often used in applications where other loaders, such as wheeled loaders, excavators, etc., are too large or complex for the particular job at hand, or to perform a particular task. Additionally, since skid-steer loaders are wheeled loaders, they have a smaller footprint and can be more maneuverable than other loaders, such as wheeled loaders. Skid-steer loaders typically include three wheels, two at the rear, and one at the front of the loader. Each rear wheel is typically driven by a traction or drive motor such as a hydraulic motor or electric motor. The angle of the front wheel can be selectively adjusted to steer the loader. Thus, the front wheel can pivot between an up and a down position to steer the loader from a neutral position. The loader may also include a hydraulic system that connects the rear or traction motors to the front or swivel-action hydraulic motor. The hydraulic system may also connect the lift cylinders and other hydraulic valves to the hydraulic motors. Typically, a control valve is used to control flow to the hydraulic motors, and thereby controlling the load applied to each of the rear wheels. The control valve may be connected to an operator-operated actuator device, such as a lever or pedal, that controls the control valve. Thus, the operator can adjust the amount of pressure applied to each of the rear wheels to cause the loader to move and turn as desired. Skid-steer loaders typically include a mast with an operator cab and implement actuator controls mounted on the mast. The controls are sometimes mounted on the outer end of the mast and the mast may be mounted on a loader frame. The loader frame
